New Communications Module Update!

Spectrum Controls is proud to announce our latest 1.04 InView firmware release! With the addition of several new features, our communications module is more powerful than ever before. Our latest firmware is focused on improving and simplifying the overall user experience. In the past, tag mapping was tedious and time-consuming to get right. Now, with our NEW Easy Tag functionality, we have streamlined the interaction with the PLC, eliminating the need for special PLC programming (this includes Rockwell Automation Add-On Instructions). The Easy Tag feature simplifies programming and reduces the time required to program your display.

The new 1.04 release will support our new full-color InView display (available in September). Also included in the 1.04 firmware release:

- Bi-directional message scrolling (supported on RGB displays only).
- Modbus TCP/IP Protocol Support (In addition to EtherNet/IP & TCP/IP).
- Improved Diagnostics
- Import old IMS software message files in .csv format

Existing customers can seamlessly update their existing communications modules with this new firmware to take advantage of the new features we've added to the browser-based programming tool they are used to.

Technical phone support is provided directly from Rockwell Automation's TechConnect program and is available worldwide at no additional cost with the purchase of all Spectrum Controls InView marquee displays and I/O modules. InView, and all of Spectrum Controls products, are available through your local Rockwell Automation distributor.

Sincerely,

Joe North
Vice President of Sales & Marketing
